

# Project Proposal

Juan Carlos Cruz - ira406

ME 5703 Lean Product Development and Service Systems

## Introduction

The Department of Defense (DoD), which includes the U.S. Army, Navy, Air Force, Marine Corps, Space Force, National Security Agency, Defense Intelligence Agency, National Geospatial-Intelligence Agency, and National Reconnaissance Office, is traditionally viewed as a bureaucratic and slow-moving organization due to its sheer size and complexity.

For my research proposal, I aim to investigate the implementation of lean and six-sigma principles within the DoD and its affiliated organizations to identify if these principles have been successful in improving the efficiency and effectiveness of the DoD. To better understand research trends regarding lean and six-sigma implementation regarding the DoD, a scientometric review is conducted. Following the procedure outlined in [1], the review begins by selecting an appropriate database, tailoring a search term criteria, filtering the results, and then analyzing the key research themes appearing across the resulting works.

The complete citation dataset, analysis code, and figures can be found at [https://github.com/jc-cr/lean\\_dod\\_paper](https://github.com/jc-cr/lean_dod_paper).

## Scientometric Setup

ProQuest was selected as the primary database for this search as it yielded the most results, 481 total, including Theses, Trade journals, Scholarly Articles, and Conference Papers.

The author also reviewed the Web of Science, Lens, and the Defense Technical Information Center, but found these to have insufficient paper results for this analysis.

One downside to this search method is that valuable "Grey literature" including government web articles and reports are not included within the analysis, this limitation will be covered in the final report by including such literature in the final review.

The search term used in ProQuest was as follows:

```
AB("Department of Defense" OR "DoD" OR "DOD" OR "U.S. Army" OR  
"Department of the Army" OR "U.S. Navy" OR "Department of the Navy" OR  
"U.S. Air Force" OR "Department of the Air Force" OR "U.S. Marine Corps" OR  
"U.S. Space Force" OR "National Security Agency" OR "NSA" OR  
"Defense Intelligence Agency" OR "DIA" OR "National Geospatial-Intelligence  
Agency" OR "NGA" OR "National Reconnaissance Office" OR "NRO")  
AND FT("six sigma" OR "6σ" OR "lean six sigma" OR  
"continuous process improvement" OR "LSS") AND LA(EN)
```

The resulting papers were inspected and cleaned manually for irrelevant documents or duplicates, leaving 465 documents to analyze. The results were exported to a xlsx file and then analyzed with a python script.

The python analysis program was setup to output graphs related to the following items:

- **Publication Trend Analysis:** Temporal distribution of publications by year, including trend lines and 3-year moving averages to identify patterns in research activity.
- **Document Type Classification:** Analysis of publication types (e.g., journal articles, case studies, dissertations).
- **Keyword Analysis:** Extraction and frequency analysis of keywords from abstracts, including removal of common stopwords and use of lemmatization for term normalization.
- **Network Analysis:** Construction of keyword co-occurrence networks to visualize relationships between concepts in the literature, with filtering to highlight the most significant connections.
- **Topic Modeling:** Latent Dirichlet Allocation (LDA) modeling to identify underlying thematic structures across the corpus of abstracts.
- **Thematic Trend Analysis:** From prior analysis, analysis of the identified themes in the literature over time.
- **Thematic Distribution:** Distribution of themes across the corpus of abstracts.

The results and figures generated from these analysis methods are presented in the following sections.

## Scientometric Analysis

As seen in Figure 1, from the earliest publications found in 1992 up to 2025, there has been an increasing trend for lean six sigma related publication related to the DoD and it's affiliated organizations. The year 2017 saw the most amount of publication related to lean six sigma and the DoD. Interestingly, since 2017 there has been a downward trend in lean six sigma literature.

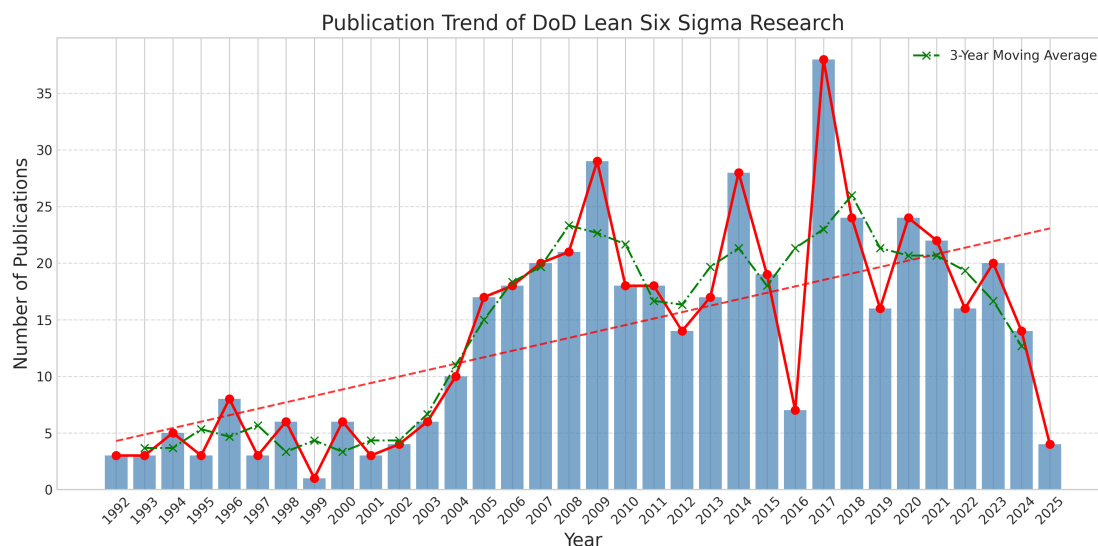

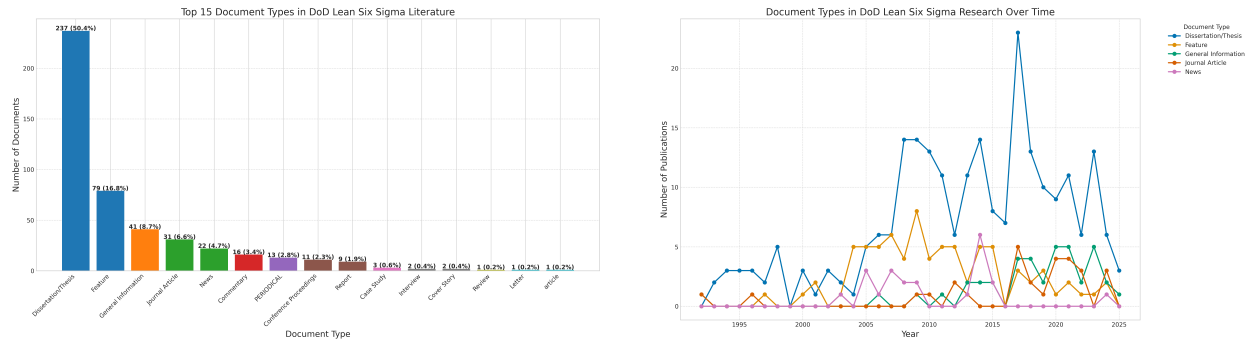

Figure 1: Publications in lean six sigma from database search

(a) Types of publications found in the database search (b) Trend over time for the different document types

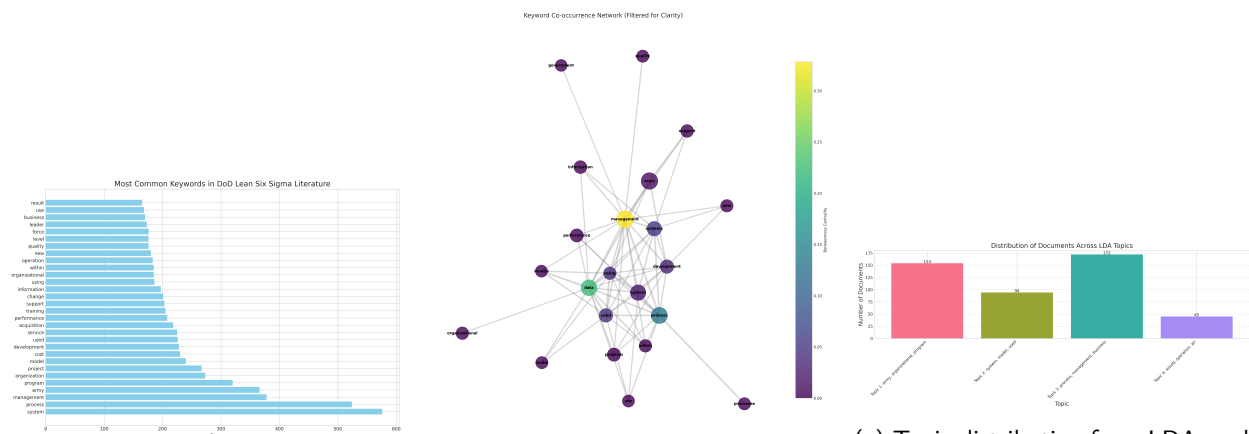

Figure 2: Analysis of document types and their trends over time

The majority of the publication types found in the ProQuest database are Dissertation/Thesis, with Feature, and General Information documents following after. This is visualized in Figure 2a. The trends over time for the different document classes is shown in Figure 2b.

Analyzing the keywords present in the document abstracts, Figure 3a shows that *system*, *process*, and *management* appear with the highest frequency across all documents.

From the co-occurrence network in Figure 3b, we observe that *management*, *data*, and *process* have a high betweenness centrality, indicating they serve as important bridges connecting other keywords in the literature. This suggests these concepts play central roles in linking different aspects of lean six sigma implementation within DoD contexts.

A Latent Dirichlet Allocation method uncovered the following key topic areas, shown in Figure 3c, *Organization*, *System*, *Process/Management*, and *Operation*.

(a) Keyword appearance frequency (b) Keyword co-occurrence network (c) Topic distribution from LDA analysis

Figure 3: Keyword analysis and topic modeling results

Using all the prior analysis points, the author determined three main themes in the lean six sigma literature: *Management and Leadership*, *Process Improvement*, and *Continuous Learning*. Using these three themes, a keyword-based categorization algorithm was applied to classify each document according to the most similar theme.

As visualized in Figure 4a, the majority of the papers (54%) corresponded to the *Management and Leadership* theme, 35.9% fell into the *Process Improvement* theme, and 9.2% fell into the *Continuous*

*Learning* theme. The distribution of themes over the years is shown in Figure 4b.

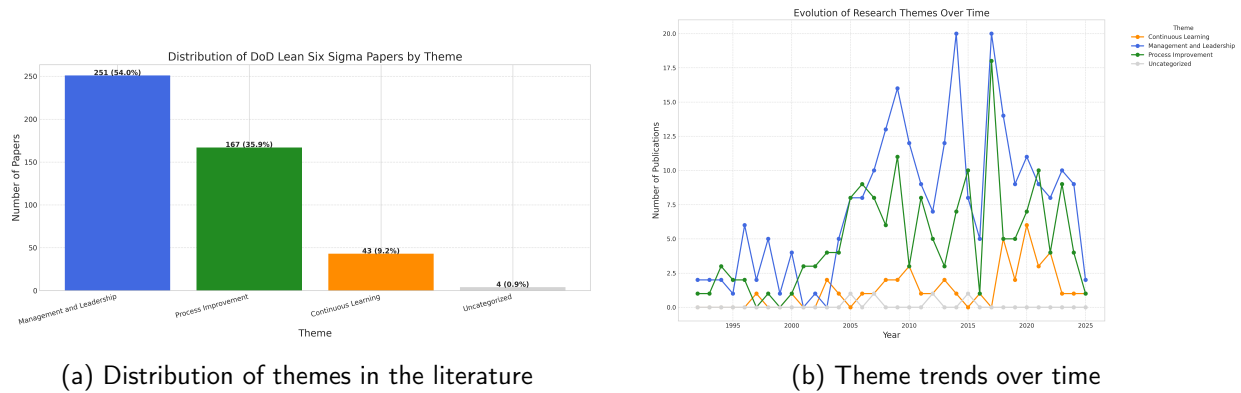

Figure 4: Thematic analysis of lean six sigma literature in DoD contexts

## Next Steps and Timeline

From our scientometric analysis we see that lean six sigma literature relating to the DoD broadly falls into three main themes: *Management and Leadership*, on *Process Improvement* and *Continuous Learning*.

The next steps in the literature review process would be to read through key papers in each thematic category and explore how these themes are being applied. Finally, the findings would be summarized and any future research directions would be identified.

A timeline for this process is given in Figure 5.

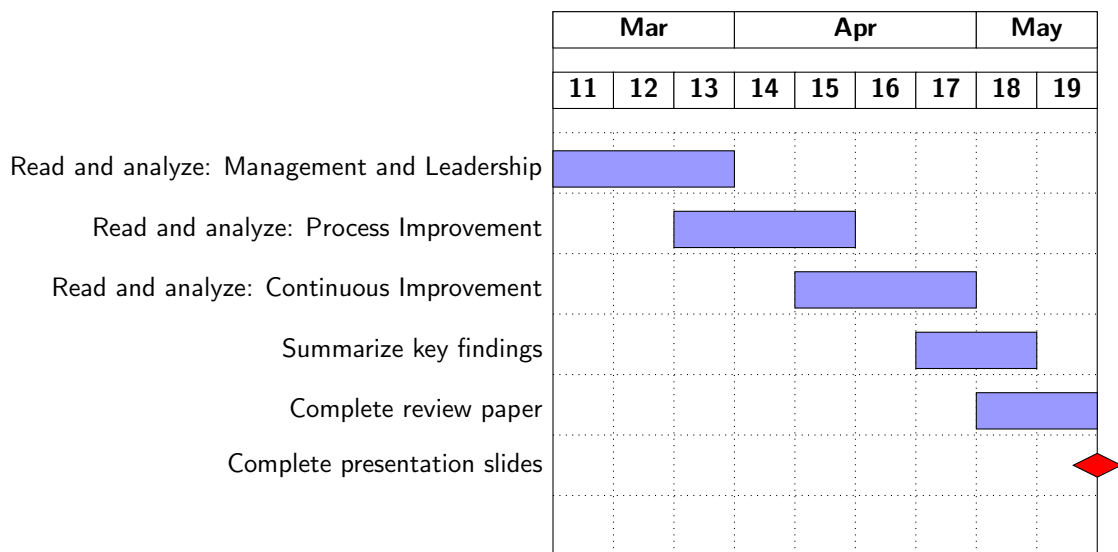

Figure 5: Timeline for literature review by week number
